

How to save files

Part-1-SQLite(.sqbpro): After executing all the commands/answers, click on the **Save project tab** on the top and save the file name as **yourname.sqbpro** As shown below:

Part-2-MySQL(.SQL): After executing all the commands/answers, click on the file menu on the top left and save as **Yourname.sql**.

As shown below:

Extended Project- (SQLite & MYSQL)

You are hired by a chain of online retail stores “**Fastkart**”. They have provided you with “**Fastkart**” database and seek answers to the following queries as the results from these queries will help the company in making data driven decisions that will impact the overall growth of the online retail stores.

1st part- Q1-Q6 comes under SQLite and queries should be executed in DB Browser. (Database - **Fastkart.db**)

2nd part- Q7-Q10 comes under MYSQL and the queries should be executed in MYSQL. (SQL Script - **Fastkart.sql**)

All Questions carry 8 marks. Total Marks (8 x 10) = 80

ER Diagram

Part-1(SQLite)

1. List Top 3 products based on QuantityAvailable. (productid, productname, QuantityAvailable).

(3 Rows) [Note: Products]

2. Display EmailId of those customers who have done more than ten purchases. (EmailId, Total_Transactions).

(5 Rows) [Note: Purchasedetails, products]

3. List the Total QuantityAvailable category wise in descending order. (Name of the category, QuantityAvailable)

(7 Rows) [Note: products, categories]

4. Display ProductId, ProductName, CategoryName, Total_Purchased_Quantity for the product which has been sold maximum in terms of quantity?

(1 Row) [Note: purchasedetails, products, categories]

5. Display the number of male and female customers in fastkart.

(2 Rows) [Note: roles, users]

6. Display ProductId, ProductName, Price and Item_Classes of all the products where Item_Classes are as follows:

If the price of an item is less than 2,000 then "**Affordable**",

If the price of an item is in between 2,000 and 50,000 then "**High End Stuff**",

If the price of an item is more than 50,000 then "**Luxury**".

(57 Rows)

Part-2(MYSQL)

7. Write a query to display ProductId, ProductName, CategoryName, Old_Price(price) and New_Price as per the following criteria

- a. If the category is “**Motors**”, decrease the price by 3000
- b. If the category is “**Electronics**”, increase the price by 50
- c. If the category is “**Fashion**”, increase the price by 150

For the rest of the categories price remains same.

Hint: Use case statement, there should be no permanent change done in table/DB.

(57 Rows)

[Note: products, categories]

8. Display the percentage of females present among all Users. (Round up to 2 decimal places)
Add “%” sign while displaying the percentage.

(1 Row)

[Note: users]

9. Display the average balance for both card types for those records only where CVVNumber > 333 and NameOnCard ends with the alphabet “e”.

(2 Rows) [Note: carddetails]

10. What is the 2nd most valuable item available which does not belong to the “Motor” category.

Value of an item = Price * QuantityAvailable. Display ProductName, CategoryName, value.

(1 Row)

[Note: products, categories]
